The 5082-7300 numeric indicator decodes positive 8421 BCD logic inputs into characters 0-9, a "-" sign, a test pattern, and four blanks in the invalid BCD states. The unit employs a right-hand decimal point.

The 5082-7302 is the same as the 5082-7300, except that the decimal point is located on the lefthand side of the digit.

The 5082-7340 hexadecimal indicator decodes positive 8421 logic inputs into 16 states, 0-9 and A-F. In place of the decimal point
an input is provided for blanking the display (all LEDs off), without losing the contents of the memory. Applications include terminals and computer systems using the base16 character set.

The 5082-7304 is a ( $\pm 1$ ) overrange display including a righthand decimal point.

## Applications

Typical applications include point-of-sale terminals, instrumentation, and computer systems.
